Overview 1
What's Changing? 1
Timeline 1

Overview

This release changes the structure of the Encounter and User Exports in a few ways: two existing fields are renamed for Abridge Assistant, one retired field is removed, and new fields describe Visit Diagnosis and CDI Query Engine activity on each encounter.

What's Changing?

Renamed Fields in "*Encounter Export*" and "*User Export*"

Definitions are unchanged

- `abridge_assistant_used` - Renamed from `abridge_ai_used`.
- `total_abridge_assistant_queries` - Renamed from `total_abridge_ai_queries`.

Removed Field in "*Encounter Export*"

- `verbatim_present` - Verbatim mode is retired, and this field has been FALSE on every encounter since September 1, 2026.

Updated Effort Reduction Fields

Field names and positions are unchanged

- `percent_effort_reduction_hpi_ap` (Encounter Export) and `average_%_effort_reduction_hpi_ap` (User Export) - When a clinician filed the note to the EHR without making any edits, effort reduction was blank. It now reads 100%, which matches the field definition (a value of 100% means the clinician made no edits). Notes not yet filed to the EHR stay blank, and existing scores don't change.
- Averages will read slightly higher because these notes were previously left out of them.

New Fields in "*Encounter Export*"

Added to the end of each weekly export

General

- `abridge_content_viewed` - TRUE if the clinician viewed or interacted with Abridge content for this encounter (the note, diagnosis codes or CDI queries), in Abridge or in the EHR.

Visit Diagnosis *(encounters with notes generated where coded diagnoses were enabled; blank otherwise)*

- `num_dx_precharted` - The number of diagnosis codes already on the encounter's visit diagnosis list in the EHR (pre-charted) that Abridge matched to a diagnosis in the note.
- `num_dx_generated` - The number of diagnosis codes Abridge generated from the visit conversation. Does not include pre-charted codes.
- `num_dx_delivered` - The number of Abridge-generated diagnosis codes written to the EHR on the encounter's most recent send.

CDI Query Engine, queries and cues *(encounters where the Query Engine ran; blank otherwise)*

- `num_cdi_queries_generated` - The number of queries and cues the Query Engine generated for the encounter.
- `num_cdi_queries_resolved` - The number of queries the clinician answered or skipped, plus cues the clinician reviewed.

Timeline

Monday, November 30, 2026 - Starting this week, exports will include the changes described above.
